Assignment: Design & Implement a Pre-Launch SaaS MVP web application

You're joining a B2B SaaS startup (e.g B-eff.com) providing a solution for a greener society. The product is in its **pre-launch phase**. Your task is to build the **public landing and early user onboarding experience**, along with a **user dashboard**, including a **profile page with GDPR or similar user compliant features**

🎯 Objectives

Design and implement a responsive landing page, dashboard, profile, and user onboarding experience page to support early user acquisition.

Part 1: Frontend Implementation

Using **React (with TypeScript)** and **Tailwind CSS**, implement the frontend based on your Figma designs:

- Build a responsive landing page
- Develop the full onboarding experience [Registration/Login]
- A responsive User Dashboard (either mocked data or API for user stats)
- A user profile page with any two GDPR or similar compliant features [You can use mocked data here if you like]

Ensure the frontend is cleanly structured, responsive, and accessible.

Part 2: Backend

Create a minimal backend to support user's onboarding and offboarding:

- Implement APIs for the user onboarding experience
- Include basic server-side data validation

Use either the NestJS or FastAPI framework, keeping the backend simple and functional.

Deliverables

1. **Source Code (Frontend + Backend)**
    a. Host on GitHub and ensure proper project structure and README
2. **Brief Documentation** (in the README or separate doc):
    a. Explanation of your design choices

    b. How you approached UI/UX intuitiveness
3. **Figma Link (Bonus)**
    a. Include your prototype and a short rationale for your design decisions
